

ADHD FOR TEACHERS by Ned Hallowell

50 Tips on the Classroom Management of ADHD

The following tips on classroom management of ADHD were presented in *Driven to Distraction*. They are revised, updated, and reprinted here because we have heard from many teachers that they have found them to be very helpful. These techniques will assist all students, whether they had ADHD or not, but they are especially helpful for students who have ADHD.

Teachers know what many professionals do not: that there is no one syndrome of ADHD, but many; that ADHD rarely occurs in "pure" form by itself, but rather usually shows up entangled with several other problems such as learning disabilities or mood problems; that the face of ADHD changes with the weather, inconstant and unpredictable; and that the treatment for ADHD, despite what may be serenely elucidated in various texts, remains a task of hard work and devotion.

There is no easy solution for the management of ADHD in the classroom, or at home for that matter. After all is said and done, the effectiveness of any treatment for this disorder at school depends upon the knowledge and the persistence of the school and the individual teacher.

If the teacher can master the following tips, teaching children with ADHD should become much easier and more effective. These kids can transform over the school year. They can change from being your most frustrating students to your most rewarding. With the persistent and consistent application of the techniques contained in these tips, and with the cooperation of the rest of the school faculty, the parents, and the student, you can see frustration evolve, step by step, into mastery and success.

These suggestions are intended for teachers of children of all ages. Some suggestions will be obviously more appropriate for younger children, others for older, but the unifying themes of structure, education, and encouragement pertain to all.

1. First of all, make sure what you are dealing with really is ADHD. It is definitely not up to the teacher to diagnose ADHD, but you can and should raise questions. Specifically, make sure someone has tested the child's hearing and vision recently, and make sure other medical problems have been ruled out. Make sure an adequate evaluation has been done. Keep questioning until you are convinced. The responsibility for seeing to all of this is the parents', not the teacher's, but the teacher can support the process.
2. Second, build your support. Being a teacher in a classroom where there are two or three kids with ADHD can be extremely tiring. Make sure you have the support of the school and the parents. Make sure there is a knowledgeable person with whom you can consult when you have a problem (learning specialist, child psychiatrist, social worker, school psychologist, pediatrician—the person's degree doesn't really matter. What matters is that he or she knows lots about ADHD, has seen lots of kids with ADHD, knows his or

her way around a classroom, and speaks plainly.) Make sure the parents are working with you. Make sure your colleagues can help you out.

3. Third, know your limits. Don't be afraid to ask for help. You, as a teacher, cannot be expected to be an expert on ADHD. You should feel comfortable in asking for help when you feel you need it.
4. Ask the child what will help. This obvious step is almost always overlooked. We adults are usually so busy trying to figure out by ourselves what is best for these children, what we should be to or for them, that we forget to ask them what they think will help. These kids are often very intuitive. They can tell you how they can learn best if you ask them. They are often too embarrassed to volunteer information because it can be rather eccentric. But try to sit down with the child individually and ask how he or she learns best. By far the best "expert" on the how the child learns best is the child himself or herself. It is amazing how often their opinions are ignored or not asked for. In ADDITION, especially with older kids, make sure the child understands what ADHD is. This will help both of you a lot.
5. Remember the emotional part of learning. Priscilla Vail has written a wonderful book stressing this point called. *Emotion: The On/Off Switch for Learning*. These children need special help in finding enjoyment in the classroom, mastery instead of failure and frustration, excitement instead of boredom or fear. It is essential to pay attention to the emotions involved in the learning process.
6. Remember that ADHD kids need structure. They need their environment to structure externally what they can't structure internally on their own. Make lists. Children with ADHD benefit greatly from having a table or list to refer back to when they get lost in what they're doing. They need reminders. They need previews. They need repetition. They need direction. They need limits. They need structure.
7. Post rules. Have them written down and in full view. The children will be reassured by knowing what is expected of them.
8. Repeat directions. Write down directions. Speak directions. Repeat directions. People with ADHD need to hear things more than once.
9. Make frequent eye contact. You can "bring back" an ADHD child with eye contact. Do it often. A glance can retrieve a child from a daydream or give permission to ask a question or just give silent reassurance.
10. Seat the ADHD child near your desk or wherever you are most of the time. This helps stave off the drifting away that so bedevils these children.
11. Set limits, boundaries. This is containing and soothing, not punitive. Do it consistently, predictably, promptly, and plainly. DON'T get into complicated, lawyerlike discussions of fairness. These long discussions are just a diversion. Take charge.

12. Have as predictable a schedule as possible. Post it on the blackboard or the child's desk. Refer to it often. If you are going to vary it, as most interesting teachers do, give lots of warning and preparation. Transitions and unannounced changes are very difficult for these children. They become discombobulated around them. Take special care to prepare for transitions well in advance. Announce what is going to happen, then give repeat reminders as the time approaches.

13. Try to help the children make their own schedules for after school in an effort to avoid one of the hallmarks of ADHD: procrastination.

14. Eliminate or reduce frequency of timed tests. There is not great educational value to timed tests, and they definitely do not allow many children with ADHD to show what they know.

15. Allow for escape valve outlets such as leaving class for a moment. If this can be built into the rules of the classroom, it will allow the child to leave the room rather than "lose it," and in so doing begin to learn important tools of self-observation and self-modulation.

16. Go for quality rather than quantity of homework. Children with ADHD often need a reduced load. As long as they are learning the concepts, they should be allowed this. They will put in the same amount of study time, just not get buried under more than they can handle.

17. Monitor progress often. Children with ADHD benefit greatly from frequent feedback. It helps keep them on track, lets them know what is expected of them and if they are meeting their goals, and can be very encouraging.

18. Break down large tasks into small tasks. This is one of the most crucial of all teaching techniques for children with ADHD. Large tasks quickly overwhelm the child and he recoils with an emotional "I'll-NEVER-be-able-to-do-THAT" kind of response. By breaking the task down into manageable parts, each component looking small enough to be do-able, the child can sidestep the emotion of being overwhelmed. In general, these kids can do a lot more than they think they can. By breaking tasks down, the teacher can let the child prove this to himself or herself. With small children this can be extremely helpful in avoiding tantrums born of anticipatory frustration. And with older children it can help them avoid the defeatist attitude that so often gets in their way. And it helps in many other ways, too. You should do it all the time.

19. Let yourself be playful, have fun, be unconventional, be flamboyant. People with ADHD love play. They respond to it with enthusiasm. It helps keep attention—the kids attention and yours as well. These children are full of life—they love adventure. And above all they hate being bored. So much of their "treatment" involves boring-sounding stuff like structure, schedules, lists, and rules, that you want to show them that those things do not have to go hand in hand with being a boring person, a boring teacher, or running a boring classroom. Every once in a while, if you can let yourself be a little bit

silly, that will help a lot.

20. Still again, watch out for over stimulation. Like a pot on the fire, ADHD can boil over. You need to be able to reduce the heat in a hurry. Use techniques like falling silent yourself, or sitting down, or putting your fingers to your lips to say, "Hush," or even turning down the lights to reduce the stimulation in the classroom. There is always a fire underneath the pot of the classroom. You, as the teacher, need to be expert at regulating the intensity of that flame. Turn it up when the class is flat. Turn it down when the class is bubbling over.

21. Seek out and underscore success as much as possible. These kids live with so much failure; they need all the positive handling they can get. This point cannot be overemphasized: these children need and benefit from praise. They love encouragement. They drink it up and grow from it. And without it, they shrink and wither. Often the most devastating aspect of ADHD is not the ADHD itself, but the secondary damage done to self-esteem. So water these children well with encouragement and praise.

22. Memory is often a problem with these kids. Teach them little tricks like mnemonics, flashcards, etc. They often have problems with what Dr. Mel Levine, a developmental pediatrician and one of the great figures in the field of learning problems, calls "active working memory," the space available on your mind's worktable, so to speak. Any little tricks you can devise—cues, rhymes, codes and the like—can help a great deal to enhance memory.

23. Use outlines. Teach outlining. Teach underlining. These techniques do not come easily to children with ADHD, but once they learn them the techniques can help a great deal in that they structure and shape what is being learned as it is being learned. This helps give the child a sense of mastery DURING THE LEARNING PROCESS, when he or she needs it most, rather than the dim sense of futility that is so often the defining emotion of these kids' learning.

24. Announce what you are going to say before you say it. Say it. Then repeat what you have said. Since many ADHD children learn better visually than by voice, if you can write what you're going to say as well as say it, that can be most helpful. This kind of structuring glues the ideas in place.

25. Simplify instructions. Simplify choices. Simplify scheduling. The simpler the verbiage the more likely it will be comprehended. And use colorful language. Like color coding, colorful language keeps attention.

26. Use feedback that helps the child become self-observant. Children with ADHD tend to be poor self-observers. They often have no idea how they come across or how they have been behaving. Try to give them this information in a constructive way. Ask questions like, "Do you know what you just did?" or "How do you think you might have said that differently?" or "Why do you think that other girl looked sad when you said what you said?" Ask questions that promote self-observation.

27. Make expectations explicit.

28. A point system can help as part of behavioral modification or reward system for younger children. Children with ADHD respond well to incentives. Many are born entrepreneurs.

29. If the child seems has trouble reading social cues—body language, tone of voice, timing and the like—try discreetly to offer specific and explicit advice as social coaching. For example, say, "Before you tell your story, ask to hear the other person's first," or, "Look at the other person when he's talking." Many children with ADHD are viewed as indifferent or selfish, when in fact they just haven't learned how to interact in a way that will make others like them. This skill does not come naturally to all children, but it can be taught or coached.

30. Teach test-taking skills. The following 5 are particularly important for students with A.D.D:

a. Show up on time for the test.

b. Always read the directions first.

c. Look over the whole test before starting on it.

d. Budget your time (unless obviously, the test is untimed, as it should be for students w/ ADHD).

e. On multiple-choice tests with a separate answer sheet, take great care to put your answer in the correct box or circle.

31. Make a game out of learning at times. Use other ploys to increase motivation, particularly with dry topics like grammar or vocabulary. Motivation and novelty tend to overcome the symptoms of ADHD

32. Separate pairs and trios of children, whole clusters even, that don't do well together. You might have to try many arrangements until you find the one that works best.

33. Pay attention to connectedness. These kids need to feel engaged, connected. As long as they are engaged, they will feel motivated and be less likely to tune out.

34. Give responsibility back to the child whenever possible. Let him devise his own method for remembering what to put into his book bag, or let him ask you for help rather than your telling him he needs it.

35. Try a home-to-school-to-home notebook. This can really help with the day-to-day

parent-teacher communication and avoid the crisis meetings. It also helps with the frequent feedback these kids need.

36. Try to use daily progress reports. These may be given to the child to hand on to his parents, or if the child is older, read directly to the child. These are not intended as disciplinary, but rather informative, and encouraging.

37. Physical devices such as timers and buzzers can help with self-monitoring. For example, if a child cannot remember when to take his or her medication a wrist alarm can help, rather than transferring responsibility to the teacher. Or during study time, a timer placed on his desk can help the child know exactly where the time is going.

38. Prepare for unstructured time. These kids need to know in advance what is going to happen so they can prepare for it internally. If they suddenly are given unstructured time, it can be over-stimulating.

39. Praise, stroke, approve, encourage, nourish.

40. With older children, suggest they write little notes to themselves to remind them of their questions about what is being taught. In essence, they can take notes not only on what is being said to them, but what they are thinking as well. This will help them listen more effectively.

41. Handwriting is difficult for many of these children. Consider developing alternatives, like learning how to type or taking some tests orally.

42. Be like the conductor of a symphony. Get the orchestra's attention before beginning. (You may use silence, or the tapping of your baton, to do this.) Keep the class "in time," pointing to different parts of the room as you need their help.

43. When possible, arrange for student to have a "study buddy" in each subject, with phone number (adapted from Gary Smith, who has written an excellent series of suggestions on classroom management).

44. Explain to the rest of the class any special treatment the child receives in order to normalize it and avoid stigma. It is a common mistake that pretending there is no problem or trying to hide the special treatment will prevent the other children from noticing it and making fun of the child. The opposite is true. Avoidance and secrecy only heighten the mystery and make the ADHD child seem stranger. An honest, straightforward approach works best.

45. Meet with parents often. Avoid the pattern of meeting only when there are problems or crises.

46. Encourage reading aloud at home. Read aloud in class as much as possible. Use story telling. Help the child build the skill of staying on one topic.

47. Repeat, repeat, repeat.

48. Encourage physical exercise. One of the best treatments for ADHD, in both children and adults, is exercise, preferably vigorous exercise. Exercise helps work off excess energy, it helps focus attention, it stimulates certain hormones and neurochemicals that are beneficial. Suggest exercise that is fun: either team sports, such as volleyball and soccer, or individual exercise the child can do alone, such as swimming, jumping rope, or jogging.

You may also use exercise when the child is acting up or seems over-stimulated in the classroom. Instead of sending him to the principal's office, tell him to go out and run around the building a few times, not as a punishment, but as a means of letting off excess energy (This works well at home, too).

49. With older children, stress preparation prior to coming into class. The better idea the child has of what will be discussed on any given day, the more likely the material will be mastered in class.

50. Always be on the lookout for sparkling moments. These kids are far more talented and gifted than they often seem. They are full of creativity, play, spontaneity, and good cheer. They tend to be resilient, always bouncing back. They tend to be generous of spirit, and glad to help out. They usually have a "special something" that enhances whatever setting they're in. Remember, there is a melody inside that cacophony, a symphony yet to be written.
